DELPHI WEB STUDIO • HANDS-ON TESTING

Build and test your first website

A practical, illustrated walk-through using the sample graphics and bulletin included with this project.

Your practice site: a welcoming community website with a home page, a photo, and a PDF bulletin.

> **Current status:** This is an experimental browser test version, not a finished Delphi desktop application. Nothing is published by the steps in this guide.

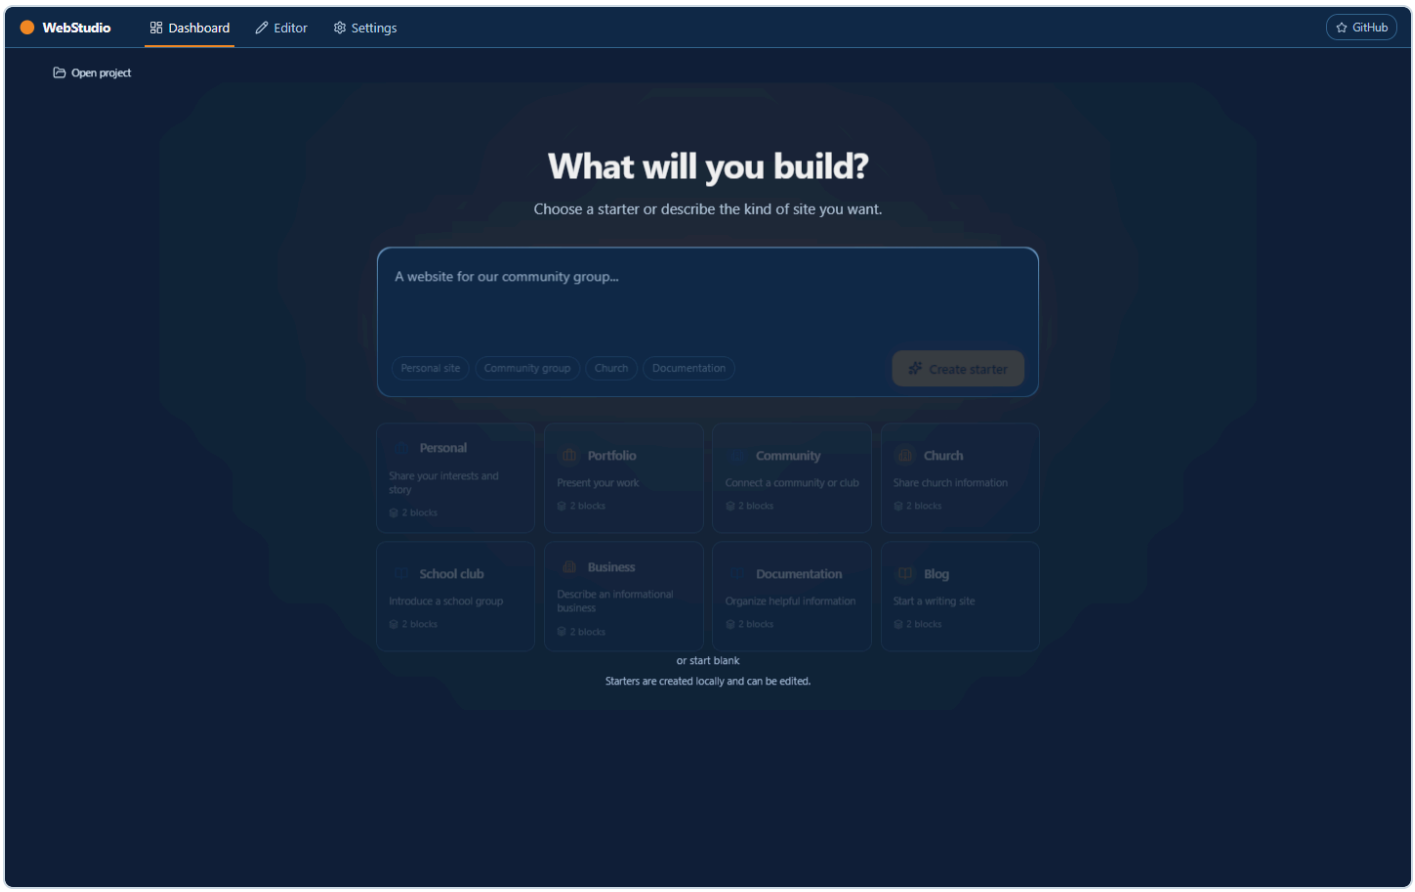

Before you begin

- Use Microsoft Edge or another current desktop browser.
- Allow about 20-30 minutes. Your work is stored in this browser; also save a project file.
- Have this project's **images and icons** and **samples** folders available.

Prepared October 30, 2026 • Test guide for the current development build

Open the test version

1. Open **http://127.0.0.1:5176/** in your browser. This address works only while the local test server is running on this PC.
2. If the page does not open, start the server using the instructions on page 6, then refresh the address.
3. On the dashboard, choose **Community**. A starter project opens in the editor.

Dashboard: choose the Community starter in the row of starter cards. Your own dashboard may also list saved projects.

What you should see

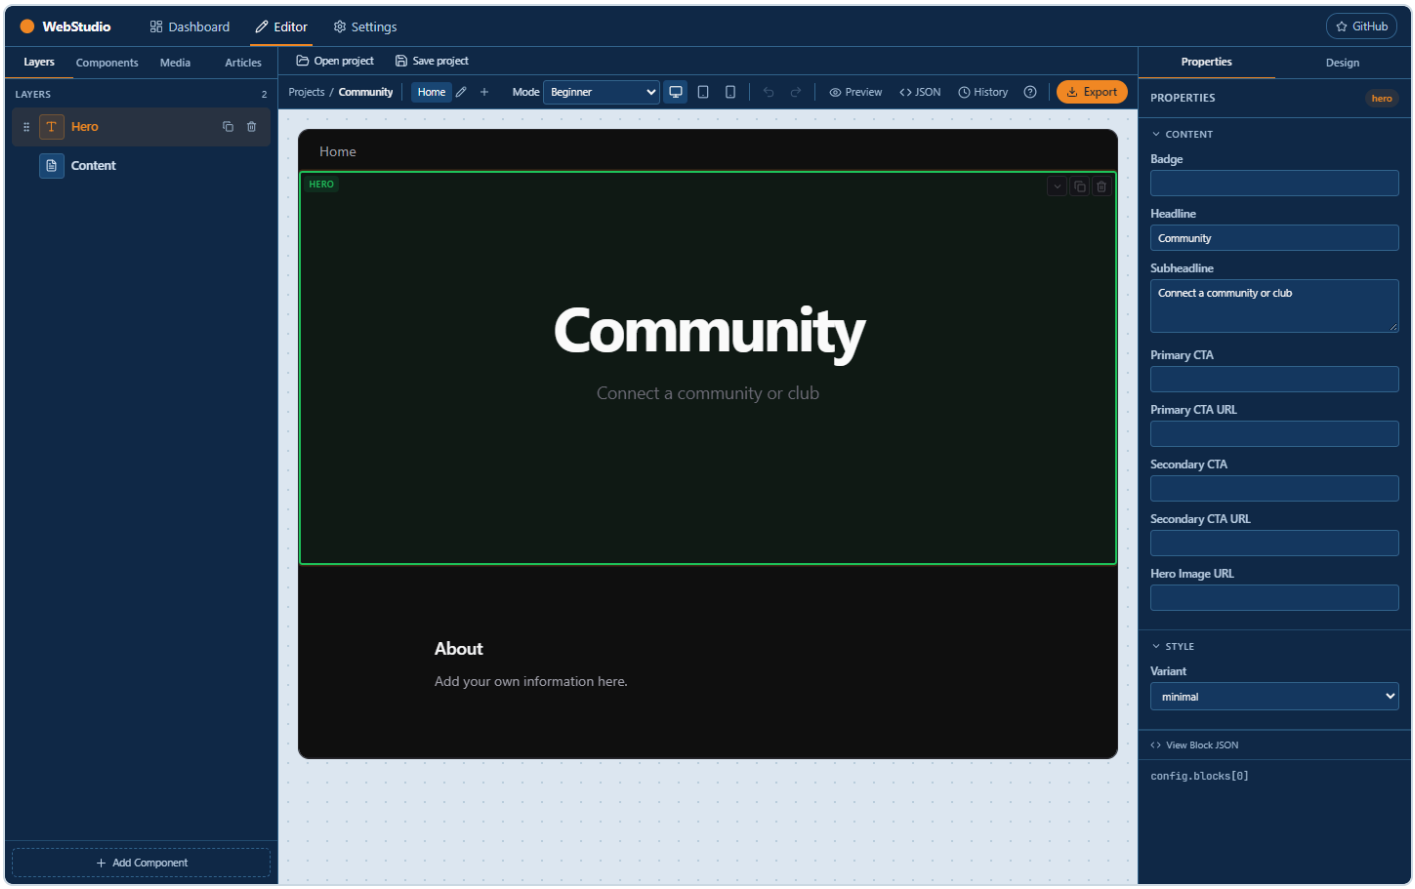

The editor opens with a **Home** page, a Hero section and a Content section. The test site starts locally; no website is sent to the internet.

> **Keep your real work safe:** These steps create a separate practice project. Use sample text and files while you explore.

02 • EDIT YOUR PAGES

Change words and add a page

1. In **Layers** at the left, select **Hero**. On the right, choose **Properties** and change **Headline** to **Welcome to Our Community**. Change the subheadline to **Neighbors, ideas, and activities for everyone.**
2. Select **Content** and replace its text with a short introduction, such as **We bring neighbors together to learn, create, and share.**
3. Click the **+** beside the Home page tab. Enter **News** and path **/news**, then choose **Add Page**.
4. Switch between **Home** and **News**. Use **Undo** and **Redo** to try reversing an edit.

Editor: Layers are on the left, your page is in the middle, and Properties are on the right. Page tabs and preview controls sit above the canvas.

> The pencil beside the selected page renames it. Deleting a page requires a second click; Undo can restore a page deletion.

03 • ADD IMAGES AND A PDF

Use the ready-made files

The three image files are in **C:\New Delphi Projects\Delphi Web Studio\images and icons**:

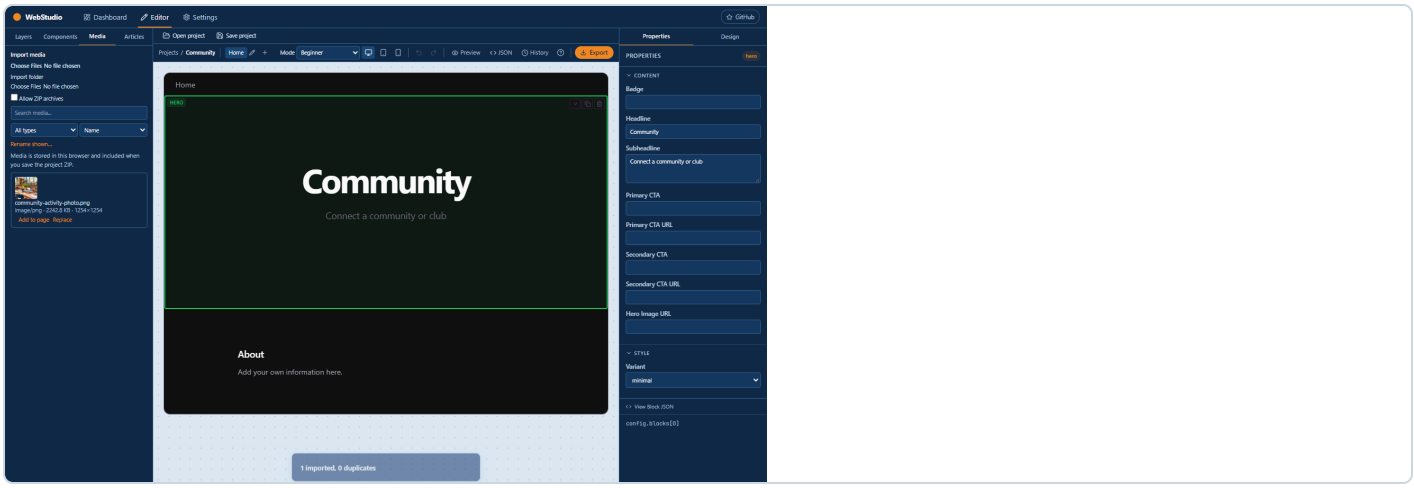

community-park-banner.png (wide scene) | **community-activity-photo.png** (square photo) | **community-house-icon.png** (transparent icon)

1. Select the page where the image belongs. Choose **Media** in the left sidebar, then **Import media**. Select one or more images from the folder above.
2. Under the desired filename, choose **Add to page**. Select the new image block to edit its properties and description. Repeat for another image or the icon.
3. For a PDF, import **Community_Bulletin_Sample.pdf** from the project's **samples** folder. Choose **Preview PDF** to inspect it, or **Add to page** to place a viewer on the page.

Media sidebar: import files, then use the action beneath each filename. Other documents can also be added as downloads.

04 • CHECK, SAVE AND REOPEN

Test the site at different sizes

1. Use the **Desktop**, **Tablet**, and **Mobile** icons in the top toolbar. Check that text, images, and navigation remain readable without unwanted overlap or horizontal scrolling.
2. Click **Preview** for a cleaner view. Click it again to return to editing. Open the PDF and try its page controls and text search for **neighbors**.
3. Choose **Save project**. A browser download starts; choose a location you can find again. With media, the file is a **.webstudio.zip**. Keep this file as your portable copy.
4. Return to the dashboard, choose **Open project**, and select the saved file. Verify your pages, text, images and PDF remain present. Opening makes a separate local copy.
5. Choose **Export** to download a website ZIP. Extract it to a new folder and open its **index.html**. Try the page links and PDF viewer; if a browser restricts local PDF viewing, test it using a local web server.

> **Save project** saves the editable project. **Export** produces website files. Neither step publishes your website. Publishing and full responsive behavior are still being developed.

Quick checklist

□ **Words changed** □ **Image visible** □ **PDF opens** □ **Pages reopen**
□ **Desktop/tablet/mobile checked** □ **ZIP exported and inspected**

If something fails, note the page, the button you pressed, what you expected and what happened. A screenshot is useful.

05 • RESTART AND TROUBLESHOOTING

If the test page is not running

For this development build, open **PowerShell** and enter these three lines. Keep that window open while testing; the last line starts the local server.

```
cd 'C:\New Delphi Projects\Delphi Web Studio'
$env:VITE_WEBSTUDIO_PROJECTS='true'
& 'C:\Program Files\WindowsApps\OpenAI.CodexPrimaryRuntime.v26-1017-2736-0_26.1017.2736.0_x64__3k8sg7r9htsxt\dependencies\node\bin\node.exe' node_modules/vite/bin/vite.js --host 127.0.0.1 --port 5176 --strictPort
```

Then open **http://127.0.0.1:5176/**. If the Node path changes after a Codex update or the port is already in use, ask for an updated launcher or the address of the running server.

Common questions

What you see	What to do
There is no Save project button	Open a project and make sure the server was started with the feature setting shown above.
The editor says no project selected	Go to Dashboard and open your project card, or choose Open project and select your saved project file.
A download is hard to find	Check your browser's Downloads list and Windows Downloads folder. Save a separate project copy regularly.
An image or PDF is missing after reopening	Open the saved project ZIP, not an exported website ZIP, and record the file and steps for the developer.

The app is under development. Local AI, the installed Windows shell, and secure publishing are not yet complete. Your API key is not required for this exercise.
