DELPHI WEB STUDIO • HANDS-ON TESTING

Build and test your first website

A practical, illustrated walk-through using the sample graphics and bulletin included with this project.

Your practice site: a welcoming community website with a home page, a photo, and a PDF bulletin.

> **Current status:** This is an experimental Windows preview, not a finished Delphi desktop application. Nothing is published by the steps in this guide.

Before you begin

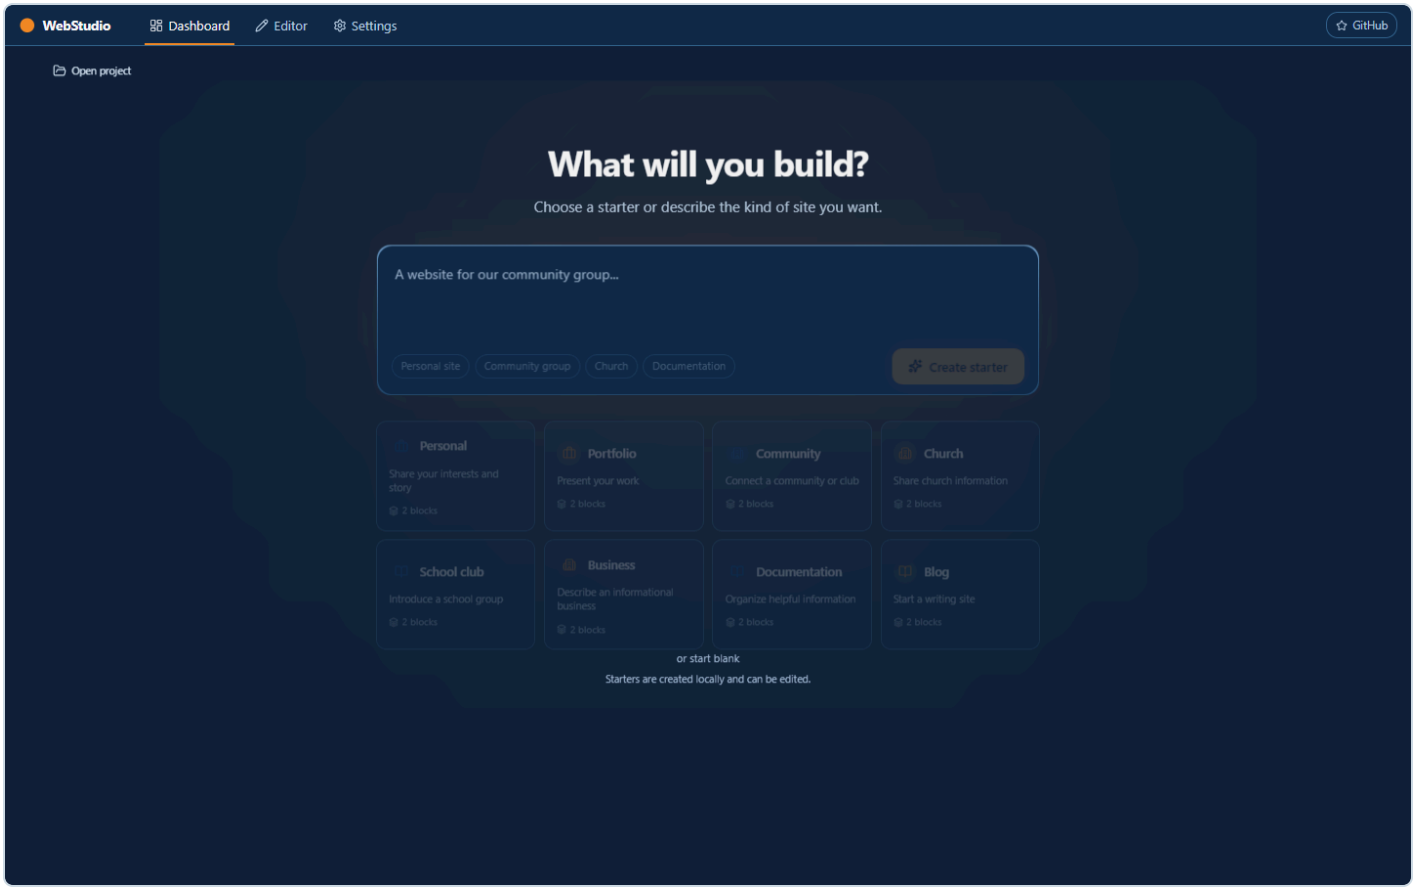

- Use Windows with the Microsoft Edge WebView2 Runtime installed.
- Allow about 20-30 minutes. Your draft is stored locally; also save a separate project file.
- Have this project's **images and icons** and **samples** folders available.

Updated October 31, 2026 • Test guide for the current development build

01 • START AND CHOOSE A DESIGN

Open the test version

1. Open the project folder, then open **bin** and **DelphiWebStudio-Preview-20261031-1045**.
2. Double-click **DelphiWebStudio.exe**. If it does not open, see the troubleshooting page.
3. On the dashboard, choose **Community**. A starter project opens in the editor.

Dashboard: choose the Community starter in the row of starter cards. Your own dashboard may also list saved projects.

What you should see

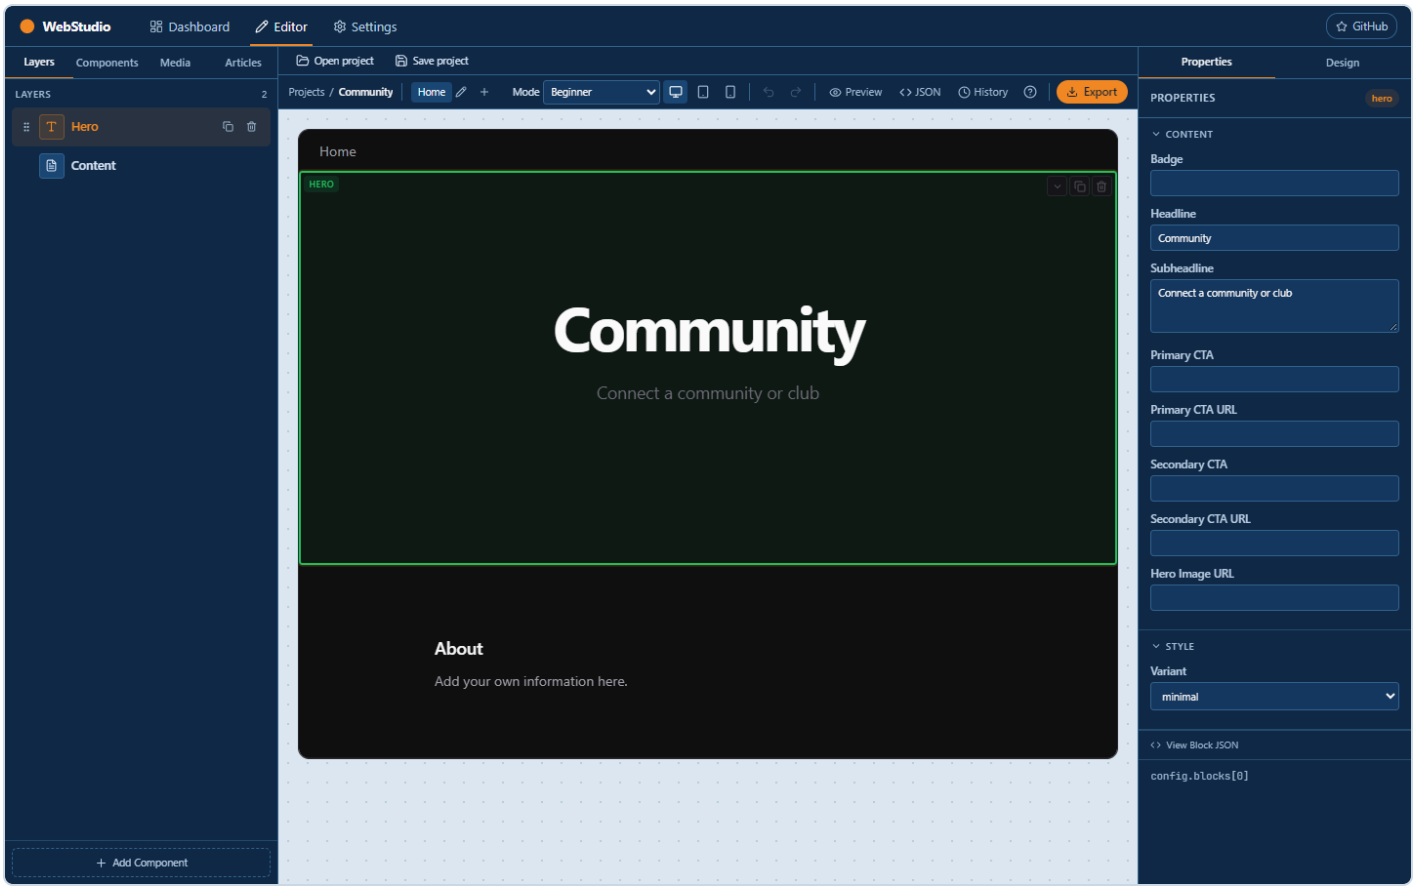

The editor opens with a **Home** page, a Hero section and a Content section. The test site starts locally; no website is sent to the internet.

> **Keep your real work safe:** These steps create a separate practice project. Use sample text and files while you explore.

02 • EDIT YOUR PAGES

Change words and add a page

1. In **Layers** at the left, select **Hero**. On the right, choose **Properties** and change **Headline** to **Welcome to Our Community**. Change the subheadline to **Neighbors, ideas, and activities for everyone.**
2. Select **Content** and replace its text with a short introduction, such as **We bring neighbors together to learn, create, and share.**
3. Click the **+** beside the Home page tab. Enter **News** and path **/news**, then choose **Add Page**.
4. Switch between **Home** and **News**. Use **Undo** and **Redo** to try reversing an edit.

Editor: Layers are on the left, your page is in the middle, and Properties are on the right. Page tabs and preview controls sit above the canvas.

> The pencil beside the selected page renames it. Deleting a page requires a second click; Undo can restore a page deletion.

03 • ADD IMAGES AND A PDF

Use the ready-made files

The three image files are in **C:\New Delphi Projects\Delphi Web Studio\images and icons**:

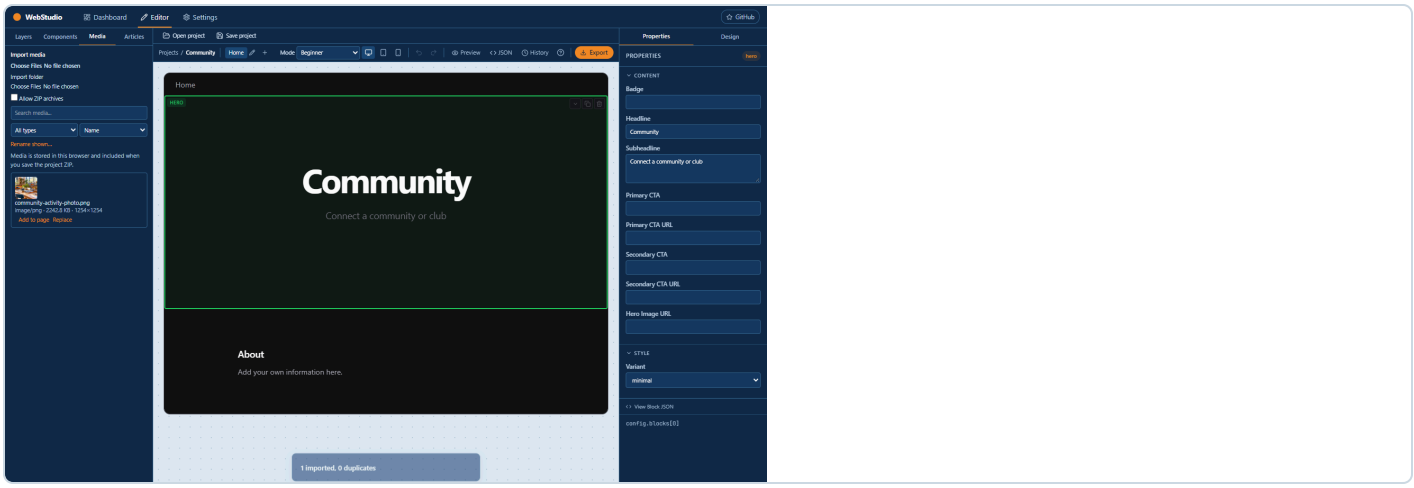

community-park-banner.png (wide scene) | **community-activity-photo.png** (square photo) | **community-house-icon.png** (transparent icon)

1. Select the page where the image belongs. Choose **Media** in the left sidebar, then **Import media**. Select one or more images from the folder above.
2. Under the desired filename, choose **Add to page**. Select the new image block to edit its properties and description. Repeat for another image or the icon.
3. For a PDF, import **Community_Bulletin_Sample.pdf** from the project's **samples** folder. Choose **Preview PDF** to inspect it, or **Add to page** to place a viewer on the page.

Media sidebar: import files, then use the action beneath each filename. Other documents can also be added as downloads.

04 • CHECK, SAVE AND REOPEN

Test the site at different sizes

1. Use the **Desktop**, **Tablet**, and **Mobile** icons in the top toolbar. Check that text, images, and navigation remain readable without unwanted overlap or horizontal scrolling.
2. Click **Preview** for a cleaner view. Click it again to return to editing. Open the PDF and try its page controls and text search for **neighbors**.
3. Choose **Save project**. A Windows Save dialog opens; choose a new filename and location you can find again; keep the suggested extension. With media, the file is a **.webstudio.zip**. Wait for the status line to report the download outcome, then keep this file as your portable copy.
4. Return to the dashboard, choose **Open project**, and select the saved file. Verify your pages, text, images and PDF remain present. Opening makes a separate local copy.
5. Choose **Export** and select a destination in the Save dialog to create a website ZIP. Extract it to a new folder and open its **index.html**. Try the page links and PDF viewer; if a browser restricts local PDF viewing, test it using a local web server.

> **Save project** saves the editable project. **Export** produces website files. Neither step publishes your website. Publishing and full responsive behavior are still being developed.

Quick checklist

□ **Words changed** □ **Image visible** □ **PDF opens** □ **Pages reopen**
□ **Desktop/tablet/mobile checked** □ **ZIP exported and inspected**

If something fails, note the page, the button you pressed, what you expected and what happened. A screenshot is useful.

05 • RESTART AND TROUBLESHOOTING

If the preview does not open

Open **C:\New Delphi Projects\Delphi Web Studio\bin\DelphiWebStudio-Preview-20261031-1045** and run **DelphiWebStudio.exe**. The executable and its **editor** folder must remain together.

The preview needs the Microsoft Edge WebView2 Runtime. If the editor does not start, record the message shown in the status line and tell the developer.

Common questions

What you see	What to do
There is no Save project button	Choose a starter or open an existing project first.
The Save dialog appears	Choose a location and filename. Cancel stops the download. Project saves require a new filename; existing project files are not replaced. Keep the suggested .json or .zip extension.
A saved file is hard to find	Look in the folder you selected in the Save dialog. Save separate project copies regularly.
An image or PDF is missing after reopening	Open the saved project ZIP, not an exported website ZIP, and record the file and steps for the developer.

> The modern Save dialog still needs interactive testing. The app is experimental: native atomic saves, local AI and secure publishing are not yet complete.

The screenshots show representative editor screens; labels and layout may differ slightly in the current preview. Your API key is not required for this exercise.
